## Vascular Infusion and Sampling System for Small Animals

VASCULAR INFUSION AND SAMPLING SYSTEM FOR SMALL ANIMALS

The catheter is surgically inserted into the target location (jugular vein, carotid artery, bile duct, portal vein, etc.), and the Implant Button is then fixed subcutaneously, allowing simultaneous drug administration and blood sampling. It is suitable for manual continuous and repeated blood sampling and drug administration, long-term automatic drug administration and blood sampling by machine.

### Features:

- Suitable for up to 10 sampling sites such as jugular vein, carotid artery, femoral vein and bile duct.
- The design is compact and firm, not easy to be damaged by animals, and the biocompatibility has been verified by experiments.
- It can be matched with syringes, catheters and other sampling methods.
- Effectively reduce the stress reaction caused by repeated injection.

## Components

COMPONENTS

### Implant Button

The Implant Button consists of transparent shell, magnet, felt and capillary tube. Catheter is connected to capillary tube and inserted into a blood vessel. The Button is implanted subcutaneously and fixed by suturing the epidermis.

### Pharmport

The Pharmport consists of shell (red and white) and capillary tube, sizes: 25g and 22g. The Pharmport is connected with the Implant Button as a simple infusion and blood sampling device.

### Catheter connector

The Catheter connector is composed of shell and capillary tube, size: 25G, 22G. For connecting Pharmport and PE tubes in vitro.

### Syringe connector

Syringe connector is composed of transparent shell and capillary tube, with a size of 25G. The front end of the injection needle can be directly inserted into the Pharmport for infusion and blood sampling, the rear end can be connected with the standard syringe.

### Implant Button Cap

The Implant Button cap is made of high quality duralumin alloy and magnet. When the Implant Button is not in use, The cap can be used to ensure that the injection end is not contaminated. The magnet allows the operator to quickly attach the cap to Implant Button.

### Handling

The Handling is made of high quality duralumin alloy and magnet. Fix the animal with one end of the Handling to pull out the Implant Button Cap, and then use the other end (including magnet) to continue to fix the animal for infusion or blood sampling operation.

### Catheter

The size of the catheter matches the capillary of the Implant Button, and the catheter can be inserted into the blood vessels of experimental animals. The node ensures that the catheter is not easy to fall off after implantation.

## Microinjection Cannula

### MICROINJECTION CANNULA

The microinjection cannula is designed for stereotaxically implant the guide cannula in the targeted brain region of the experimental animals for acute and chronic intracranial drug administration. RWD offers customized services for users, the users can customize according to specific experimental requirements.

### Features:

- One implantation for multiple drug administration, protecting the animal's brain from repeated injury.
- The animals can be administered while awake and for the subsequent experiments.
- Different specifications are available for precise drug administration in different regions of rat and mouse brains.
- Single cannula and double cannula are available to meet requirements for injections in unilateral brain regions or bilateral brain regions.

### composition:

#### ① Guide cannula

Guide cannula consists of a threaded cylindrical plastic pedestal and a stainless steel tube. It has to be preimplanted into brain and fixed with dental cement. Both dummy cannula and internal cannula can be inserted into guide cannula individually.

#### ② Internal cannula

Internal cannula can be fixed into guide cannula through fixing screw and its tail end is connected with PU tube for injections. The length can be customized.

#### ③ Fixing screw

Fixing screw fixes internal cannula to guide cannula.

#### ④ Screw

Screw provides the dental cement with a point of strength to prevent it from falling off.

#### ⑤ Dummy cannula

Stainless steel wire and threaded plastic cap make a dummy cannula. It can be inserted into guide cannula and fixed by screw to seal the guide cannula and prevent outflow of tissue fluid after injection. The length of the stainless steel wire can be customized.

#### ⑥ Metal Cannula

The metal materials avoid biting after the cannula implantation

#### ⑦ PU Tube

PU tube connects with the internal cannula on one end and syringe on the other end for drug injection.

#### ⑧ Plug

Plug connects with PU tube on the one end and with syringes of different sizes on the other end.

## MCAO Sutures

### MCAO SUTURES

RWD MCAO suture utilizes high-quality nylon thread to induce ischemic stroke model. The within-group variation of stroke models can be reduced by the super smooth surface and evenness of RWD suture. Without rupturing the vesicle, RWD suture makes its insertion into the animal brain much easier. The stability is also increased for the cerebral ischemia modeling. Diameters of silicone-rubber coated part range from 0.19mm to 0.44mm; Length of suture from 2-3cm.
